Cytokine, 4-1BB ligand (4-1BB-L) - binds to cell surface receptor 4-1BB to transduce signal.

Example 1; Page 44-45; 65pp; English.

The 4-1BB polypeptide (receptor) and the 4-1BB-L (cytokine, see AAQ75422) are useful in a pharmaceutical composition for stimulating the immune system. The 4-1BB and 4-1BB-L polypeptides are also useful for exploring mechanisms of T-cell activation, as they are expressed on T lymphocytes. 4-1BB-L can be used as a tissue culture reagent for in vitro cultivation of primary T-cells during the derivation of clonal T-cell lines. It may also be used to stimulate proliferation of activated T-cells, used in therapeutic procedures. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel murine receptor protein 4-1BB (AAW04173) has the potential to function as an accessory signaling molecule during T-cell activation and proliferation. It may represent a cell surface molecule involved in T-cell-APC interactions and may also act as a B-cell costimulator. It is structurally related to members of the nerve growth factor receptor superfamily. Its amino acid sequence was deduced from an isolated cDNA clone (see also AAT39541). A human homologue, H4-1BB (AAW04174), was identified and used to raise a monoclonal antibody useful in cancer and autoimmune disease therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Monoclonal antibody specific for human receptor protein 4\text{-}1BB - used to enhance proliferation and activation of T-cells for treatment of cancer and to inhibit specific ligand binding for treating auto:immune diseases

This protein comprises mouse 4-1BB, a member of the tumour necrosis factor receptor superfamily that is expressed on helper, suppressor and cytolytic T cells, as well as on mouse brain tissue. A novel claimed cytokine, designated 4-1BB ligand (4-1BB-L) has been identified, cloned and sequenced (see AAW26656) that binds to murine 4-1BB. 4-1BB-L, especially its soluble extracellular domain, can be used to stimulate T-cell proliferation in vitro, as a research tool and as an affinity ligand for purifying 4-1BB. (Updated on 25-MAR-2003 to correct PF field.)

The present sequence is mouse 4-1BB receptor protein. This protein has 65% homology with human receptor protein 4-1BB. The protein has a putative leader sequence, a potential membrane anchor segment and other features of known receptor proteins. 4-1BB is structurally related to members of the nerve growth factor receptor. Probes derived from mouse 4-1BB cDNA are used to isolate cDNA of H4-1BB. The H4-1BB protein, its ligands, and various monoclonal antibodies have therapeutic uses. They may be used to enhance or suppress T cell activation and proliferation;

Use of monocyte growth factor CD137 for stimulating proliferation of peripheral monocytes, particularly for treating immune deficiency, e.g. following cancer therapy

Disclosure; Fig 1B; 57pp; German.

This invention describes a novel use of the human monocyte growth factor CD137, or its functional analogs, for (i) stimulating proliferation of

```
peripheral monocytes; and (ii) treating diseases that are associated with disorders of a cellular system that includes monocytes (and/or their disorders of a cellular system that includes monocytes (and/or their progression is treatable by stimulating proliferation of such cells. The products of the invention have antitumor, antiboacterial, antiviral, antifungal and immunostimulatory activity. Stimulating proliferation of monocytes promotes the non-specific immune response, i.e. it increases phagocytosis and intracellular destruction of microorganisms, immune cytotoxicity to tumor cells. CD137 is used, in vivo or ex vivo, to treat diseases associated with a defective immune response where caused by inadequate numbers of active monocytes/macrophages, especially damage to therapy; disorders of wound healing (e.g. in dialysis or diabetic therapy; disorders of wound healing (e.g. in dialysis or diabetic patients, or those with chronic venous insufficiency); tumors; bacterial, fungal or viral infections; (non-)congenital or (non-)inherited diseases or injury to the immune system; injury induced by treatment with disease, or transplant patients with chronic arthritis or autoimmune confinency in gene therapy procedures. Proliferation of peripheral monocytes is achieved independently of hematopoietic stem cells. This sequence represents the murine CD137 protein described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180

                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated and purified cDNA containing mouse lymphokine designated L2G25B. L2G25B cDNA encodes lymphokine macrophage inflammatory protein 1 alpha (MIP-1alpha). Lymphokines are proteins by which the immune cells communicate with each other. Lymphokines are used therapeutically against immunologic diseases. Mouse lymphokine MIP-alpha can be used to modulate early myeloid progenitor cell differentiation. The present sequence is mouse lymphokine receptor 4-1BB protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                 New isolated and purified cDNA designated L25G25B encoding the mouse lymphokine macrophage inflammatory protein 1 alpha which can be used for modulating early myeloid progenitor cell differentiation.

The present sequence is the protein sequence of the murine cytokine receptor, 4-1BB. A portion of the extracellular (ligand binding) domain of the receptor was utilised in a murine 4-1BB/human 1gG1 Fc fusion protein, which was used to identify the murine 4-1BB ligand (4-1BB-L, see ABB75952). The invention provides novel murine and human 4-1BB-L polypeptides and human 4-1BB polypeptides, as well as DNA sequences encoding them, recombinant expression vectors and host cells, and methods for producing the novel polypeptides by cultivating the transformed host cells. Soluble forms of the 4-1BB-L and 4-1BB polypeptides, derived from their extracellular domains, have therapeutic value. Antibodies that are immunoreactive with 4-1BB-L or human 4-1BB are claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LGTFNDQNGTGVCRPWTNCSLDGRSVLKTGTTEKDVVCGPPVVSFSPSTTISVTPEGGPG

The invention relates to a novel cDNA gene encoding receptor protein 4-18B. The CDNA gene of the invention demonstrates immunostimulant activities and may be useful as a probe to isolate DNA sequences encoding for proteins similar to the receptor protein encoded by the DNA. The protein, its fragments and derivatives may be useful as a probe to isolate ligands to receptor protein 4-18B, for stimulating proliferation of B cells expressing 4-1BB ligands and for blocking 4-1BB ligand binding. The antibody may be useful for enhancing T-cell proliferation or activation. Finally, the invention may be useful with respect to cancer research. The current sequence is that of the murine receptor 4-1BB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a cDNA, which encodes for human receptor protein H4-1BB. The cDNA, or its fragments or derivatives, are useful as a probe to isolate DNA sequences encoding for proteins similar to the receptor protein H4-1BB. The receptor protein H4-1BB, or its fragments or derivatives, is useful as a probe for identifying ligands to the receptor protein H4-1BB, or for stimulating the proliferation of B-cells expressing H4-1BB ligands. The monoclonal antibodies against H4-1BB are useful for enhancing T-cell proliferation of activation. The cDNA or receptor protein H4-1BB is also useful for blocking H4-1BB ligand binding, which is particularly useful for suppressing the immune system during transplantation, or for treating autoimmune diseases. This is the amino acid sequence of mouse receptor H4-1BB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for treating conditions leading to bone loss. The method comprises administering a purified and isolated osteoprotegerin (OPG) protein (AAF57836-AAF57838 and AAB66974-AAB66976) in conjunction with other substances such as tumour necrosis factor-alpha in conjunction with other substances such as tumour necrosis factor-alpha (TNF-alpha) inhibitors, interleukin (IL)-6, -8 and -18 inhibitors, ICE modulators, fibroblast growth factor (FGF)1-10 modulators and/or platelet activating factor (PAF) antagonists. The method is useful for treating to bone loss such as rheumatoid arthritis, multiple sclerosis, osteoporosis, osteomy-slutis and asthma. The method is also useful for treating inflammation, systemic lupus erythematosus (SLE) and graft-versus-host disease (GVHD). Other diseases that can be treated include acute pancreatitis, Alzheimer's disease, anorexia, atherosclerosis, coronary conditions (e.g. myocardial infarction), cancer, diabetes, endometriosis, fever, glomerulonephritis, hyperalgesia, inflammatory bowel disease, ischaemia, pain, Parkinson's disease, peoriasis and septic shock. The present sequence was used in a sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating conditions leading to bone loss such as rheumatoid arthritis, multiple sclerosis and asthma, comprises administering an osteoprotegerin protein in conjunction with e.g. inhibitors of interleukin and tumor necrosis factor alpha.
                                                                                                                                                                                                                                                              Bone loss; osteoprotegerin; OPG; rheumatoid arthritis; hyperalgesia; multiple sclerosis; osteoporosis; osteomyelitis; asthma; inflammation; systemic lupus erythematosus; graft-versus-host disease; septic shock; acute pancreatitis; Alzheimer's disease; anorexia; atherosclerosis; pain; coronary condition; myocardial infarction; cancer; diabetes; psoriasis; endometriosis; fever; glomerulonephritis; inflammatory bowel disease; ischaemia; Parkinson's disease.

The 4-1BB polypeptide (receptor) and the 4-1BB-L (cytokine, see AAQ75423) are useful in a pharmaceutical composition for stimulating the immune system. The 4-1BB and 4-1BB-L polypeptides are also useful for exploring mechanisms of T-cell activation, as they are expressed on T lymphocytes. 4-1BB-L can be used as a tissue culture reagent for in vitro cultivation of primary T-cells during the derivation of clonal T-cell lines. It may also be used to stimulate proliferation of activated T-cells, used in therapeutic procedures. (Updated on 25-MAR-2003 to correct PN field.)

The PCR product was used to screen a cDNA library of activated human T-cells. The isolated cDNA (AAQ86126), deposited as NRRL AAB21131, encoded the human homolog, H4-1BB (AAR70977), of 4-1BB. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel cDNA encoding human receptor protein H4-1BB - useful to produce the protein which is used to treat auto:immune disease and facilitate organ transplantation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This protein comprises human 4-1BB, a member of the tumour necrosis factor receptor superfamily that is expressed on cells that include, but are not limited to, stimulated human peripheral blood lymphocytes. Its amino acid sequence was deduced from an isolated cDNA clone (see AAT91026) obtained from human peripheral blood T-lymphocytes. A novel claimed cytokine, designated 4-1BB ligand (4-1BB-L) has been identified, cloned and sequenced (see AAW26657) that binds to 4-1BB. 4-1BB-L,

The present sequence is a human receptor protein 4-1BB. 4-1BB is structurally related to members of the nerve growth factor receptor. It contains a putative zinc finger structure similar to that of yeast e1F-2b protein. Probes derived from mouse 4-1BB cDNA are used to isolate cDNA of H4-1BB. The H4-1BB protein, its ligands, and various monoclonal antibodies have therapeutic uses. They may be used to enhance or suppress T cell activation and proliferation; B cell proliferation; treating cancerous tumours and AIDS. The use of H4-1BB to block H4-1BB ligand binding has practical application in the suppression of immune system during organ transplantation or against autoimmune diseases including diabetes, rheumatoid arthritis, and lupus

This invention describes a novel use of the human monocyte growth factor CD137, or its functional analogs, for (i) stimulating proliferation of peripheral monocytes; and (ii) treating diseases that are associated with calsorders of a cellular system that includes monocytes (and/or their derived cells, precursor or progenitors) or where the origin and/or progression is treatable by stimulating proliferation of such cells. The products of the invention have antitumor, antibacterial, antiviral, antifungal and immunostimulatory activity. Stimulating proliferation of monocytes promotes the non-specific immune response, i.e. it increases thangocytesis and intracellular destruction of microorganisms, immune complexes and damaged cells, and improves antibody (in) dependent cytotoxicity to tumor cells, and improves antibody (in) dependent cytotoxicity to tumor cells, and improves antibody (in) dependent cytotoxicity to tumor cells, cD137 is used, in vivo or ex vivo, to treat consequate numbers of active monocytes/macrophages, especially damage to the hematopoietic system (leucopenia) caused by chemotherapy or radiation therapy; disorders of wound healing (e.g. in dialysis or diaberic patients, or those with chronic venous insufficiency); tumors; bacterial, fungal or viral infections; (non-)congenital or (non-)inherited diseases or injury to the immune system; injury induced by treatment with immune system; injury induced by treatment with cimmunesuppressants (e.g. patients with chronic activities or autoimmune consense represents the human CD137 protein described in the method of the invention
                            Use of monocyte growth factor CD137 for stimulating proliferation of peripheral monocytes, particularly for treating immune deficiency, e.following cancer therapy.
                                                                                                                                         Claim 12; Fig 1A; 57pp; German.
                            Use of mono

treatment New human 4-1BB receptor splicing variant polypeptides and polynucleotides, useful for research, diagnosis, prevention and treatmen of tumors, cytotoxicity, autoimmune diseases, acquired immunodeficiency syndrome and graft rejection.

Disclosure; Fig 2; 28pp; English.

The present invention relates to an isolated human 4-1BB receptor
splicing variant (h4-1BBSV, where 4-1BB is a member of tumour necrosis
factor (TNF) family of ligands) polypeptide. h4-1BBSV cDNA is used in
gene therapy. h4-1BBSV is useful for research, biological, clinical and
therapeutic purposes. h4-1BBSV, its fragments, analogues or derivatives
are useful as an immunogen to produce antibodies which are useful for
isolating and identifying clones expressing the polypeptide or to purify
the polypeptide. h4-1BBSV is useful for diagnosis and treatment of
disorders of cells, tissues and organisms and its nucleic acid is useful
complementary polynucleotides for e.g. as a diagnostic
for detecting complementary polynucleotides for e.g. as a diagnostic
creagent and for chromosomal identification. h4-1BBSV receptor agonists
are useful for preventing, treating tumours, restenosis, cytotoxicity,
autoimmune diseases, acquired immunodeficiency syndrome (AIDS) and graftbacterial and viral infection, deleterations effects of ionising radiation,
autoimmune diseases, acquired immune responses, wound healing and cellular
coliferation and antagonists are useful for treating and/or preventing
endotoxic shock, inflammation, cerebral malaria, activation of human
immunodeficiency virus (HIV) virus, bone resorption, graft rejection and
immunodeficiency virus (HIV) virus, bone resorption, graft rejection and

The present invention describes the human TRID protein (tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without intracellular domain, also referred to as tumour necrosis factor receptor (TNFR-5 or TR5)). TRID has cytostatic, immunosuppressive, nootropic, antiparasitic, cardiant, antiniflammatory, anticonvulsant, antiparasitic, cardiant, anti-HV, antiparkinsonian and vasotropic activities, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins and parasite, bacteria and viruses, restenosis and graft versus host disease. Comparasity are also useful for inducing proliferation of T-cells, endothelial cells and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after stimulation of TRID by consist or TRAIL binding facilitator. The antibodies which bind TRID colympeptides are useful for treating and/or preventing diseases associated with increased or decreased apoptotic cell death, The TRID colympletides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) autoimmune disorders; (c) diseases associated with increased apoptosis; (d) cardiovascular disorders; and (e) viral infection. The present sequence represents a tumour necrosis factor receptor used in comparison of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               \delta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  \stackrel{\circ}{\circ}
                                             The present sequence is the protein sequence of the human cytokine receptor, 4-1BB. The sequence was deduced from a cDNA clone (see ABL54048) obtained from a human peripheral blood T-lymphocyte cDNA library. It shows 60% identity to murine 4-1BB (see ABB75954). A portion of the extracellular (ligand binding) domain of the human 4-1BB cytokine receptor was utilised in a human 4-1BB/human IgG1 Fc fusion protein, which was used to identify the human 4-1BB ligand (4-1BB-L, see ABB75953). The invention provides novel murine and human 4-1BB-L polypeptides, as well as DNA sequences encoding them, recombinant expression vectors and host cells, and methods for producing the novel polypeptides by cultivating the transformed host cells. Soluble forms of the 4-1BB-L and 4-1BB polypeptides, derived from their extracellular domains, have therapeutic value. Antibodies that are immunoreactive with 4-1BB-L or human 4-1BB are claimed
                                                                                                                                                                                                                                                                                                                                                                        60 NCNICRVCAGYFRFKKFCSSTHNAECECIEGFHCLGPQCTRCEKDCRPGQELTKQGCKTC 119

```
The invention relates to an agonist or antagonist of MOCEPTIN (a member of the Tumour Necrosis Factor Receptor family) activity. The antagonist or agonist of MOCEPTIN activity, or the composition comprising the agonist or antagonist, is useful for preventing or treating an obesity-related disorder or disease in an individual. In particular, the agonist of MOCEPTIN activity is useful for treating or preventing obesity-related diseases, e.g. hyperlipidemia, atherosclerosis, insulin resistance, diabetes, stroke or hypertension. The agonist is also useful for reducing body mass, or for treating or preventing disorders associated with excessive weight loss, e.g. preventing disorders associated with excessive weight loss, c.g. cachexia, cancer-related weight loss, AIDS-related weight loss, chronic inflammatory disease-related weight loss, or anorexia. The present sequence represents a human MOCEPTIN polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      119

This invention describes a novel human h4-1BBSV receptor or a sequence that is at least 85% identical to the h4-1BBSV receptor. The product of the invention has anti-tumour, virucide, immunosuppressive, anti-HIV, antibacterial, antiinflammatory, protozoacide, immunomodulator and vasotropic activity and can be used for gene therapy and chromosome mapping. h4-1BBSV is useful for diagnosing a disease or susceptibility to a disease related to underexpression of h4-1BBSV or for identifying a disease related to underexpression of h4-1BBSV or for identifying a disease related to underexpression of th4-1BBSV or for identifying a disease or susceptibility to a consists and antagonists. The soluble extracellular domain of h4-1BBSV receptor polypeptide is useful for treating and/or preventing endotoxic shock, cytotoxicity, inflammation, cerebral malaria, activation of human cachexia, tumours, autoimmune disease, ionizing radiation, acquired immunodeficiency syndrome (AIDS), for providing resistance to bacteria, viruses and parasites, to induce proliferation of endothelial cells and certain haematopoietic cells, to treat restenosis and to prevent certain autoimmune diseases after stimulation of h4-1BBSV receptor by an agonist. This sequence represents the human 4-1BB receptor described in the anti-HIV; antibacterial; antiinflammatory; protozoacide; immunomodulator; vasotropic; gene therapy; chromosome mapping; extracellular domain; endotoxic shock; cytotoxicity; cerebral malaria; autoimmune disease; human immunodeficiency virus; HIV; graft-host rejection; bone resorption; cachexia; tumour; ionizing radiation; acquired immunodeficiency syndrome; AIDS; endothelial cell; proliferation; haematopoietic cell; restenosis; autoimmune disease; h4-1BB. Novel isolated h4-1BBSV receptor polypeptide, useful for treating tumors, providing resistance to bacteria, viruses and parasites, to induce proliferation of endothelial cells, and to treat restenosis. h4-1BBSV receptor; anti-tumour; virucide; immunosuppressive, Dillon PJ; Disclosure; Fig 2; 29pp; English 15-MAR-1996; 96US-0013474P. 13-MAR-1997; 97US-00816605. 22-FEB-1999; 99US-00253549. 19-DEC-2000; 2000US-00739394. 9 60 NCNICRVCAGYFRFKKFCSSTHNAECECIEGFHCLGPQCTRCEKDCRPGQELTKQGCKTC 119 120 The invention relates to a method and apparatus for applying adhesive to packaging in a variety of configurations. The method involves applying adhesive on blank while moving in one direction, which is folded, and then another quantity of adhesive is applied before moving blank to another direction. The invention is useful for e.g. soap boxes, cereal boxes, bottle carriers, can boxes. The present sequence is human protein. Note: There is no specific information about the sequence in the specification 9 1 MGNNCYNVVVIVLLLVGCEKVGAVQNSCDNCQPGTFC-RKYNPVCKSCPPSTFSSIGGQP Paper board container manufacture for soap boxes, involves applying adhesive on blank while moving in one direction, which is folded, and then another quantity of adhesive is applied before moving blank to 8; Gaps Length 255; Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises the amino acid and coding sequences of human PRO proteins. The DNA and protein sequences of the invention are useful for the diagnosis and treatment of cancer and inflammatory bowel disease (e.g. ulcerative colitis or Crohn's disease). The present amino acid sequence represents a human PRO protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ಥ

```
The invention relates to a binding domain-immunoglobulin fusion protein comprising a binding domain polypeptide that is fused to an immunoglobulin hinge region polypeptide, an immunoglobulin heavy chain CH2 constant region polypeptide that is fused to the hinge region polypeptide that is fused to the CH2 constant region polypeptide. The instance of the CH2 constant region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues, where the first cysteine is not mutated; a mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin fusion protein is capable of at least one immunological activity comprising antibody dependent cell-mediated cytotoxicity (ADCC) and complement fixation. The binding domain polypement for an encomplement fixation.

antigen. Also included are an isolated polynucleotide encoding the binding domain-immunoglobulin fusion protein, a recombinant expression construct comprising the polynucleotide (operably linked to a promoter), a host cell transformed or transfected with a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein or polynucleotide and a carrier, and treating a subject having or suspected of having a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid arthritis, myasthenia gravis, Grave's disease, type I diabetes mellitus, multiple sclerosis or autoimmune disease. The present sequence is a binding domain limunoglobulin fusion protein-associated protein sequence or the sequence. Note: The sequence at a for this patent formed part of the printed specification and is also available in electronic format directly from USPTO at sequences in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   235

                                                                                                                                                                                                                                                     The invention describes a cDNA, which encodes for human receptor protein H4-1BB. The cDNA, or its fragments or derivatives, are useful as a probe to isolate DNA sequences encoding for proteins similar to the receptor protein H4-1BB, or its fragments or derivatives, is useful as a probe for identifying ligands to the receptor protein H4-1BB, or for stimulating the proliferation of B-cells expressing H4-1BB ligands. The monocolonal antibodies against H4-1BB are useful for enhancing T-cell proliferation of activation. The cDNA or receptor protein H4-1BB is also useful for blocking H4-1BB ligand binding, which is particularly useful for suppressing the immune system during transplantation, or for treating autoimmune diseases. This is the amino acid sequence of unknown human receptor H4-1BB.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                177
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120 SLGTFNDQNGTGVCRPWTNCSLDGRSVLKTGTTEKDVVCGPPVVSFSPSTTISVTPEGGF 179
                                                                                                                                                              Monoclonal antibody specific for human receptor protein 4-1BB - used to enhance proliferation and activation of T-cells for treatment of cancer and to inhibit specific ligand binding for treating auto:immune diseases.
                                                                                                                                                                                                                             Novel human receptor protein H4-1BB (AAW04174) has the potential to function as an accessory signaling molecule during T-cell activation and proliferation. Its amino acid sequence was deduced from a cDNA clone (AAT39546) isolated from activated human T-lymphocytes. Recombinant H4-1BB can be produced in transfected host cells. It is used to isolate receptor ligands, to stimulate B-cells expressing such ligands and to block H4-1BB ligand binding. A fusion protein of H4-1BB with human placental alkaline phosphatase can be used to modify immune responses. A monoclonal antibody raised against an immunoepitope (see also AAW04172) of H4-1BB is useful in the treatment of cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                           9

This sequence represents a novel human h4-1BBSV receptor protein which is used in a method for making a human 4-1BB receptor splice variant which acts as an antagonist. The antagonist polypeptides may be used to treat/prevent disease states mediated by h4-1BBSV receptors such as endotoxic shock, inflammation, cerebral malaria, activation of the HIV virus, graft rejection, bone resorption and cachexia. The h4-1BBSV coding sequences are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 MGNNCYNVVVIVLLLVGCEKVGAVQNSCDNCQPGTFCRKYNPVCKSCPPSTFSSIGGQPN 60

This is a human 4-1BB receptor splicing variant. The 4-1BB ligand is a member of the tumour necrosis factor (TNF) family of ligands. It is induced by T-cell activation. The h4-1BBSV receptor nucleic acid and protein can be used for diagnosis and therapy. In particular, agonists of h4-1BBSV receptor can be used to treat and/or prevent tumours, restenosis, cytotoxicity, bacterial and viral infection, deleterious effects of ionising radiation, autoimmune disease, AIDS and graft-host rejection, to regulate immune responses, wound healing and cellular proliferation. Antagonists can be used to treat and/or prevent endotoxic shock, inflammation, cerebral malaria, activation of the HIV virus, graft rejection, bone resorption and cachexia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MGNSCYNIVATLLLLVLNFERTRSLQDPCSNCP-------32

This protein may be used to treat/prevent disease states mediated by h4-1BBSV receptors such as endotoxic shock, inflammation, cerebral malaria, activation of the HIV virus, graft rejection, bone resorption and cachexia. The h4-1BBSV coding sequences are useful in gene therapy. This sequence does not appear in the specification but has been created from the wild-type sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid encoding human 4-1BB receptor splicing variant - useful in treating h4-1BBSV mediated disease states such as endotoxic shock, inflammation, graft rejection and inactivation of HIV.

The present invention relates to an isolated human 4-IBB receptor splicing variant (h4-IBBSV, where 4-IBB is a member of tumour necrosis factor (TNF) family of ligands) polypeptide. h4-IBBSV cDNA is used in gene therapy. h4-IBBSV is useful for research, biological, clinical and therapeutic purposes. h4-IBBSV, its fragments, analogues or derivatives are useful as an immunogen to produce antibodies which are useful for isolating and identifying clones expressing the polypeptide or to purify the polypeptide. h4-IBBSV is useful for disorders of cells, tissues and organisms and treatment of disorders of cells, tissues and organisms and its nucleic acid is useful for detecting complementary polynucleotides for e.g. as a diagnostic reagent and for chromosomal identification. h4-IBBSV receptor agonists are useful for preventing, treating tumours, restenosis, cytotoxicity, autoimmune diseases, acquired immunodeficiency syndrome (AIDS) and graft-construction and antagonists are useful for treating and/or preventing endotoxic shock, inflammation, cerebral malaria, activation of human communodeficiency virus (HIV) virus, bone resorption, graft rejection and immunodeficiency virus (HIV) virus, bone resorption, graft rejection and immunodeficiency virus (HIV) virus, bone resorption.
                                                                           New human 4-1BB receptor splicing variant polypeptides and polynucleotides, useful for research, diagnosis, prevention and treatment of tumors, cytotoxicity, autoimmune diseases, acquired immunodeficiency syndrome and graft rejection.
                                                                                                                                                                                                                       Claim 15; Fig 1; 28pp; English.

This invention describes a novel human h4-1BBSV receptor or a sequence that is at least 85% identical to the h4-1BBSV receptor. The product of the invention has anti-tumour, virucide, immunosuppressive, anti-HIV, antibacterial, antiinflammatory, protozoacide, immunomodulator and vasotropic activity and can be used for gene therapy and chromosome company and carrent and chromosome company. h4-1BBSV is useful for diagnosing a disease or susceptibility to a disease related to underexpression of h4-1BBSV or for identifying creceptor polypeptide is useful for treating and/or preventing endotoxic shock, cytotoxicity, inflammation, cerebral malaria, activation of human immunodeficiency virus (HIV), graft-host rejection, bone resorption or cachexia, tumours, autoimmune disease, ionizing radiation, acquired cimmunodeficiency syndrome (AIDS), for providing resistance to bacteria, viruses and parasites, to induce proliferation of endothelial cells and certain haematopoletic cells, to treat restenosis and to prevent certain autoimmune diseases after stimulation of h4-1BBSV receptor by an agonist. This sequence represents the human 4-1BBSV receptor described in the constitution of the invention
AIDS; endothelial cell; proliferation; haematopoietic cell; restenosis; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated h4-1BBSV receptor polypeptide, useful for treating providing resistance to bacteria, viruses and parasites, to induce proliferation of endothelial cells, and to treat restenosis.
                                                                                                                                                                                               /label= soluble_extracellular_domain

This invention relates to an isolated nucleic acid molecule encoding a human tumour necrosis factor(TNF)-receptor related protein TR2. Included in the invention are the two splice variants of TR2, TR2-SV1 and TR2-SV2.

The TR2 gene is located on chromosome 1 at position p36.2-p36.3. TR2 is a member of the TNFR superfamily. The invention includes a method for the treatment of arthritis or inflammation using an antibody directed against a fragment of the TR2 protein. TR2 its agonists, antagonists and antibodies exhibit cytostatic, dermatological, antianaemic, antiantial anticological antiniar in the treatment of antial arthritis or inflammatory, neuroprotective, noctropic, antiparkinsonian, and cerebroprotective activity. The methods are useful for treating arthritis or inflammation, cancer (such as follicular lymphomas, carcinoma with p53 mutations, cardiac tumours, pancreatic, breast, or prostate cancer), an immunodeficiency or for enhancing an in vivo leukocyte response to an antigen. Anti-TR2 antibodies are useful for treating, inhibiting or

dermatitis, allergic encephalomyelitis, rheumation arthritis, asthma, and inflammatory myopathies) and immunodeficiency disorders (such as severely combined immunodeficiency disorders (such as severely combined immunodeficiency (SCID)-X linked, B cell lymphoproliferative disorder, or Nezelof syndrome-combined immunodeficiency with Igs). TR2, TR2-SV1 and/or TR2-SV2 polynucleotides and polypeptides, agonists or antagonists are useful for treating or preventing autoimmune diseases and inhibit the growth, progression and/or metastasis of cancers. They are also used to activate, differentiate or proliferate cancerous cells or tissues, and can be used to treat diseases associated with increased cell survival, or the inhibition of apoptosis, e.g. Alzheimer's disease, barkinson's disease, or Crohn's disease. The TR2 polypeptides are useful as sources for generating antibodies, as molecular weight markers. This sequence represents the tumour necrosis factor receptor (TNFR) domain of the human 4-1BB protein. The sequence was used in the characterisation of the TR2 receptor protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       146

Disclosure; Fig 1; 78pp; English.

The present invention describes peptides and peptide analogues which correspond in primary sequence to a binding loop of a tumour necrosis factor receptor (TNF-R) superfamily member. The compounds are especially designed from a binding loop of TNF-R p55. They are capable of inhibiting TNF binding to its cellular receptors and may be used to inhibit the biological activities of TNF. They may be used in treating TNF-associated conditions such as acute and chronic inflammatory responses, septic shock, cachexia, autoimmunity, graft-versus-host disease, skin allergic reactions, immune complex disease, transplantation rejection and malaria. Administration is, e.g. oral, transdermal, transmucosal, pulmonary, subcutaneous, intravenous or intramuscular. Parenteral dosage is 0.1-5 mg/kg/day. The present sequence represents an extracellular Cys-rich domain of TNF-R from the present invention

Use of peptides and peptide analogs which are TRANCE/RANK inhibitors, for inhibiting osteoclastogenesis and bone resorption.

Disclosure; Fig 1; 81pp; English

The present invention describes a method for inhibiting

```
osteoclastogenesis and bone resorption. Osteoclastogenesis and bone resorption inhibiting peptide analogues from the present invention have osteopathic, cytostatic, antirheumatic, antiarthritic, antiinflammatory and immunomodulatory activities, and are tumour necrosis factor (TNF)-related activation-induced cytokine (TRANCE)/ receptor activator of NF-kappaB ligand (RANK) inhibitors. The method is useful for treating disease characterised by bone loss such as osteoporosis, Paget's disease, metastatic bone disease, rheumatoid arthritis or periodontal disease, and modulating dendritic cell maturation, T cell proliferation, and/or CD40 receptor systems. The present sequence represents an extracellular Cys-rich domain of a tumour necrosis factor receptor (TNF-R) superfamily member, which is used in the exemplification of the

           controprotective, antiviral, antionflammatory, antionvalue, movinging, antiparasitic, cardiant, anti-HIV, antiparkinsonian and vasotropic activities, and can be used in gene therapy. The TRID polynucleotides are useful for detecting complementary polynucleotides. TRID proteins and polynucleotides are useful in the treatment of tumours, resistance to polynucleotides are useful in the treatment of tumours, resistance to parasite, bacteria and viruses, restenosis and graft versus host disease. They are also useful for inducing proliferation of T-cells, endothelial cells and certain haematopoietic cells, to regulate antiviral responses and to prevent certain autoimmune diseases after stimulation of TRID by an agonist or TRAIL binding facilitator. The antibodies which bind TRID polypeptides are useful for treating and/or preventing diseases associated with increased or decreased apoptotic cell death. The TRID polynucleotides, proteins, antibodies, agonists and antagonists are useful in the diagnosis, treatment or prevention of: (a) cancer; (b) autoimmune disorders; (c) diseases associated with increased apoptosis; (d) cardiovascular disorders; and (e) viral infection. The present sequence represents a tumour necrosis factor receptor used in comparison with TRID in the exemplification of the present invention

The present invention describes human tumour necrosis factor receptor 2 related protein variant (TNFR2PV). TNFR2PV has cytostatic, antiasthmatic and immunosuppressive activities, and can be used in gene therapy. The TNFR2PV cDNA or protein sequences can be used for preparing a composition for treating a disease or condition associated with increased TNF signalling e.g., cancer of the prostate, ovary, gallbladder, breast, brain, liver or colon, or inflammatory disorders, such as rheumatoid arthritis, asthma or ulcerative colitis. The present sequence represents a mouse lymphotoxin-beta receptor amino acid sequence, which is given in comparison with human TNFR2PV in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 --AMLLIAILLSLVLFLLFTTVL--ACAWMRHPSLCRKLGTLLKR------HPEGEESP 268

The present sequence represents murine osteoclast differentiation and activation receptor (ODAR). The present invention describes cottoucler (ODAR). The present invention describes osteoprotegarin (OPG) binding protein. Host cells transfected with vectors containing nucleic acid molecules encoding OPG binding protein companies are used to produce recombinant OPG binding protein. OPG binding protein camples; to screen for specific binding agents (particularly agonists and antagonists, including intracellular proteins); to raise Ab (useful in immunoassays for detection of OPG binding protein) and to identify compounds that modulate binding oFG binding protein can be used to detect of sequences, also to produce transgenic animal models, while complementary sequences are used for antisense regulation of OPG binding protein or Ab, are used to treat or prevent bone diseases, cof OPG binding protein or Ab, are used to treat or prevent bone diseases, hypercalcaemia, Paget's disease, periodontal disease, osteoporosis, bone loss caused by arthritis or metastases, hypercalcaemia, Paget's disease, periodontal disease, osteoporosis, bone of promote bone growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            107
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             LTLFLALTSALLLALIF-----ITLLFSVLKWIRKKFPHIFKOPFKKTTGAAQEEDA 238

This represents the murine muRANK (receptor activator of necrosis factor-
kappaB (NF-kB)) polypetide which is a homolog of the human RANK. RANK is
a member of the tumour necrosis factor (TNF) family. A soluble RANK may

CC a member of the tumour necrosis factor (TNF) family. A soluble RANK may

CC expressing membrane-associated RANK with a soluble RANK which binds to

CC RANK ligand (RANKL). RANKL polypeptides can activate RANK and can be used

CC SANK ligand (RANKL). RANKL polypeptides can activate RANK and can be used

CC STANK polypeptide composition may also be used for regulating an immune or

CC STANK polypeptide composition of NF-kB by RANK antagonists may be

CC inflammatory response. Inhibition of NF-kB by RANK antagonists may be

CC inflammatory response. Inhibition of NF-kB by RANK antagonists may be

CC csuseful in ameliorating negative effects of an inflammatory response that

CC result from triggering of RANK, e.g. in treating toxic shock or sepsis,

CC calls that express RANK. RANKL polypeptides can also be used to identify

CC cells that express RANK and thus inhibitors of an inflammatory response, and

also for protecting RANK-expressing cells from the negative effects of

CC chemotherapy or the presence of high levels of TNF-alpha. The products

CC can also be used for detection and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    108 TAPRRCACTAGYHWNSDC---ECCRRNTECAPGFGAQHPLQLNKDTVCTPCLLGFFSDVF

This represents the murine muRANK (receptor activator of necrosis factor-
kappaB (NF-kB)) polypetide which is a homolog of the human RANK. RANK is
a member of the tumour necrosis factor (TNF) family. Host cells
transformed or transfected with an expression vector comprising the RANK
cransformed or transfected with an expression vector comprising the RANK
cransformed or transfected with an expression vector comprising the RANK
concacting nucleic acid can be used to produce recombinant RANK protein.
The soluble RANK may be used for inhibiting activation of NF-kB, by
contacting a cell expressing membrane-associated RANK with a soluble RANK
which binds to RANK ligand (RANKL). The soluble RANK polypeptide
composition may also be used for regulating an immune or inflammatory
response. Inhibition of NF-kB by RANK antagonists may be useful in
ameliorating negative effects of an inflammatory response that result
from triggering of RANK, e.g. in treating toxic shock or sepsis, graft-
versus-host reactions, or acute inflammatory reactions. They can also be
used in adjunct therapy for disease characterised by neoplastic cells
that express RANK. The products can also be used for detection and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Galibert LJ, Maraskovsky E;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 52,

Sequence 11, Application US/09627775

Patent No. 6682739

GENERAL INFORMATION:
APPLICANT: Greene, Mark
APPLICANT: Antali, Ramachandran
APPLICANT: Baron, Roland
TITLE OF INVENTION: Methods of Inhibiting Osteoclastogenesis
FILE REFERENCE: UPN3832
CURRENT APPLICATION NUMBER: US/09/627,775
CURRENT FILING DATE: 2000-07-28

PRIOR FILING DATE: 1999-07-28

NUMBER OF SEQ ID NOS: 29

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 18.8%; Score 268; DB 4; Length 69; Best Local Similarity 63.8%; Pred.
